Release Notes Version 7.4

Deleting partial orders

Version 7.3 introduced the possibility to split standard orders into partial orders. This function enables the mapping of orders with which, for example, several departments jointly purchase goods or services in order to obtain more favorable prices. Another example is a large order from a department that is called off in several stages over a year.

Partial orders can be deleted like other order types in the detailed view of the elements on the PO tab. However, this can be very time-consuming for orders that have been split into several elements. Therefore, version 7.4 provides the possibility to delete several related partial orders in one overview.

Here the user can click the *Remove split POs* button, then the ⊖ icon will be displayed behind the partial orders. The user clicks the icon for all split partial orders that are to be deleted and then clicks *Save*. After confirming a security question, the partial orders are deleted. The order data of the elements is adjusted accordingly.
